Subject: Validation of hydroxyethylvaline adduct method

Dear Shixia,

we have finished the validation of the modified method for hydroxyethylvaline adducts (HEVal). In addition to using a deuterated HEVal-hemoglobin as internal standard, it was necessary to derivatize the adduct prior to GC-MS analysis. Method characteristics for HEVal after these modifications were integrated in the attached Quotation (3. Revision). I think you can share my view that there is a significant improvement.
We know start with the sample series from PM USA that we received a few weeks ago.

Best regards

Gerhard Scherer
